

2

optional side airbags, Toyota RAV4, Suzuki Grand Vitara/Vitara/Chevrolet Tracker, Land Rover Freelander, Mitsubishi Outlander, Saturn VUE, and Honda Element. The Jeep Wrangler and Honda CR-V are rated marginal, and the Hyundai Santa Fe is acceptable.

The Subaru Forester is the only one of the 12 small SUVs to earn a good rating in both the side impact crashworthiness evaluation and the Institute's frontal offset crash test.

The side impact test represents what happens when a passenger vehicle is struck in the side by a pickup truck or SUV at about 30 mph. The results of this test expand the Institute's program of crash tests for consumer information. For eight years the Institute has been providing comparative rankings of passenger vehicles based on performance in frontal offset crash tests at 40 mph. Now most new passenger vehicles are being designed to earn good ratings in this test.

"Our side impact test is severe," says Institute president Brian O'Neill. "Given the designs of today's vehicles, it's unlikely that people in real-world crashes as severe as this would emerge uninjured. But with good side impact protection, people should be able to survive crashes of this severity without serious injuries."

O'Neill adds that he expects this new crashworthiness evaluation program to influence consumers' car-buying choices. "This is what happened with our frontal crash test results, and now we expect consumers will use the new test results to help them choose vehicles with good occupant protection in both front and side impacts."

Because consumers pay attention to the Institute's crash test results, automakers are expected to upgrade their vehicles' side impact protection, just as they've upgraded the protection their vehicles offer in frontal crashes.

"Ideally, passenger vehicles should be good performers in both tests — a double good," O'Neill says.

#### Forester is best and Outlander is worst:

The side airbag in the Subaru Forester kept the injury measures recorded on the driver dummy relatively low. The dummy in the rear seat also recorded relatively low measures, although its head did hit the pillar behind the back door — an area required by federal standard to limit head impact forces. There was somewhat less intrusion into the Forester than into several of the other small SUVs the Institute tested.

The Ford Escape with optional side airbags also is rated good (see p.10). However, it was only a marginal performer in the Institute's frontal offset crash test.

In contrast, the Mitsubishi Outlander was the worst performer in the side impact test. There was more intrusion into the occupant compartment than in many of the other vehicles tested. The Outlander that was tested didn't have side airbags. The barrier struck the driver dummy's head, and injury measures recorded on the head as well as on the torso and pelvis were very high.

How the small SUVs are evaluated: Each vehicle's overall side impact evaluation is based on (1) injury measures recorded on the two instrumented SID-IIs dummies, (2) assessment of head protection countermeasures, and (3) each vehicle's structural performance during the impact.

(1) Injury measures are obtained from two SID-IIs dummies, one in the driver seat and the other in the rear seat behind the driver. These measures are used to determine the likelihood that a driver and/or passenger would have sustained serious injury to various body regions. Measures are recorded from the head, neck, chest, abdomen, pelvis, and leg. These injury measures, especially those from the head/neck and torso (chest and abdomen), are major components of each vehicle's overall evaluation.

(2) To supplement head injury measures, researchers evaluate the movements and contacts of the dummies' heads during the crash. This assessment is more important for seating positions without head protection airbags, which (assuming they perform as intended) should prevent injurious head contacts. Very high head injury measures

typically are recorded when the moving deformable barrier hits a dummy's head during impact. However, a "near miss" or a grazing contact also indicates a potential risk of serious injury in a real-world crash. This is because small differences in occupants' heights or in their seating positions compared with the test dummies could result in a hard contact and high risk of serious head injury. In the rear seat, the potential for serious injury is influenced by whether the seating position puts occupants' heads in proximity to areas designed with padding or something else to reduce impact forces versus areas with hard or unprotected structures.

Analysis of the movement and contact points of the dummies' heads during the crash test is used to assess this aspect of protection.

(3) Structural performance is based on measurements indicating the amount of intrusion into the occupant compartment around the B-pillar (between the doors). This assessment indicates how well a vehicle's side structure resisted intrusion into the driver and rear-seat passenger space. Some intrusion into the compartment is inevitable in serious side impacts. Any intrusion that does occur should be uni-

form both horizontally and vertically and shouldn't seriously compromise the driver and passenger space. Less intrusion helps assure that other occupants of sizes and in seating positions different from the dummies also would have lower injury risks.

These three factors determine each vehicle's overall side crashworthiness evaluation. The order in which the vehicles are listed (see facing page) depends on performance in the Institute's frontal offset crash test as well as the side impact test.

## Three main differences

Side impact tests conducted by the Institute versus the federal government:

- 1. Designs of the moving deformable barriers
- 2. Designs of the test dummies and what they measure
- 3. How the barriers move toward the vehicles being assessed

Since 1997 the federal New Car Assessment Program, which compares crashworthiness among new passenger vehicles, has included side impacts. In these tests, an impactor with a deformable front end representing the front of a car is used to strike the sides of the vehicles being assessed.

This moving deformable barrier was developed in the early 1980s, when cars represented most of the vehicles on the road. The height of the barrier's front end is below the heads of the dummies that meas-

ure injury risks in the side-struck vehicles. These federal tests don't assess the risks of head injury from impacts with vehicles like SUVs or pickups.

The changed vehicle mix and high risks to occupants of side-struck vehicles when the striking vehicles are SUVs or pickups led the Institute to modify the moving deformable barrier used in the federal test so the front end represents the geometry of a typical SUV or pickup. The result is a barrier that's higher off the ground, taller, and contoured.

The design of this barrier and choice of test speed (31 mph) reflect extensive developmental tests, including tests comparing the results from side impacts with barriers versus side impacts with SUVs and pickups.

Another difference between Institute and federal side impact tests involves the choice of test dummies. The Institute uses SID-IIs dummies, which are smaller than the dummy (SID) used in the federal government's test. SID-IIs is a newer design than SID, which was developed in the 1970s, and

it records more injury measures across more body regions.

SID-IIs represents a small (5th percentile) female or a 12 year-old. This choice of dummies reflects the fact that women are more likely than men to suffer serious head injuries in real-world side impacts (see Table 3, p.8). The head of the smaller SID-IIs driver dummy is in the window area where people's heads are more vulnerable to being struck by the front end of a striking vehicle in a real-world side impact.

#### Federal side impact test

The front of the moving deformable barrier represents vehicle designs of the early 1980s. The barrier travels toward the test vehicle along a "crabbed," or angular, path at a speed that simulates a two-vehicle intersection collision in which the striking vehicle is going 34 mph and the struck vehicle is going 17 mph.

The side impact test dummy (SID) represents an average-size male. Developed in the 1970s, SID principally is used to measure acceleration in the chest (rib cage and spine) during the test. It doesn't measure chest compression. Nor is there any measure of injury risk in the abdomen or leg.

#### Institute side impact test

The moving deformable barrier is higher off the ground and taller than in the federal test. The barrier's front end represents the front of a pickup or SUV. It travels toward the test vehicle along a perpendicular path instead of "crabbed," as in the federal test (a difference that has little effect on injury measures, according to developmental tests).

The Institute's side impact test dummy, called SID-IIs, represents a small woman or a 12 year-old. The chest of SID-IIs measures compression as well as acceleration, and this test dummy records injury risk in the abdomen, pelvis, and leg.

The design of the moving deformable barrier used in the Institute's side impact crash test reflects extensive developmental testing. This research included a pair of tests, one in which the barrier hit the side of a Ford Focus (above left) and another in which a Ford Explorer (midsize SUV) hit the side of a Focus. Damage patterns were similar, indicating the barrier does a good job of representing the damage inflicted by SUVs and pickups in real-world crashes.

#### Table 1 Driver deaths in cars 1-3 years old, per million cars registered, and percentage of deaths in front versus side impacts

CRASH TYPE	IMPACT <u>DIRECTION</u>	CA 1980-81: <u>RATE</u> <u>%</u>	LENDAR YEARS 1990-91: <u>RATE</u> <u>%</u>	2000-01: <u>RATE</u> <u>%</u>
Car and another passenger vehicle	Front	36 61	22 53	12 43
	Side	18 31	18 43	15 51
	All	59 100	42 100	29 100
All car crashes	Front	86 52	62 53	41 46
	Side	42 26	37 32	32 37
	All	164 100	117 100	87 100

Source: Fatality Analysis Reporting System, National Highway Traffic Safety Administration

(continued from p.3) 87 per million cars registered. This represents a 47 percent decline. Most of this improvement was in frontal crashes, in which driver death rates decreased from 86 to 41 per million (52 percent decline). The improvement was much smaller in side impacts — the death rate decreased from 42 to 32 per million (24 percent decline). In crashes with another passenger vehicle, 51 percent of driver deaths in recent model cars during 2000-01 occurred in side impacts, up from 31 percent in 1980-81. During the same time, the proportion of deaths in frontal crashes declined from 61 percent to 43 percent.

These changes are attributable to two effects. There have been significant improvements in

**Table 2** Percent of driver deaths in 1-3-year-old passenger vehicles struck on the driver side by another passenger vehicle, by type of striking vehicle

STRIKING VEHICLE	STRUCK VEHICLE	CA 1980-81	LENDAR YEAR 1990-91	2000-01
Car	Car	71%	61%	43%
SUV or pickup	Car	29%	39%	57%
Car	All necconger vehicles	700/	60%	43%
Cal	All passenger vehicles	70%	00%	43%
SUV or pickup	All passenger vehicles	30%	40%	57%

Source: Fatality Analysis Reporting System, National Highway Traffic Safety Administration

**Table 3** Distribution of serious and fatal injuries, by body region, to drivers of passenger vehicles struck on the driver side, calendar years 1997-2001

BODY REGION	MALE	FEMALE	TOTAL
Head, face, or neck	29%	34%	31%
Thorax	66%	51%	61%
Abdomen	14%	13%	13%
Upper extremities	15%	18%	16%
Pelvis & lower extremities	33%	38%	35%
Snine	5%	2%	4%

Notes: Serious injuries are AIS (Abbreviated Injury Scale) 3 or greater. Drivers frequently suffer AIS 3+ injuries to multiple body regions.

Source: National Automotive Sampling System/Crashworthiness Data System, National Highway Traffic Safety Administration

frontal crash protection. For example, frontal airbags are standard in new vehicles, the structural designs of vehicles are better than they used to be, and safety belt use rates are higher. At the same time, growing sales of SUVs and pickups have exacerbated height mismatches among passenger vehicles, thereby increasing the risks to occupants of many vehicles struck in the side.

Seventy-one percent of the driver deaths in cars struck on the driver side by other passenger vehicles during 1980-81 occurred when the other vehicle was a car. Twenty-nine percent occurred when the striking vehicle was a pickup or SUV. By 2000-01 these percentages had almost reversed — 57 percent of the driver deaths in cars struck on the driver side by another passenger vehicle involved striking SUVs or pickups, while 43 percent involved striking cars.

The risks to people in a side-struck vehicle greatly increase if the striking vehicle rides higher off the ground than the struck vehicle. Thus, the risks are much higher when an SUV strikes the side of a car than when the striking vehicle is another car.

#### 2003 passenger vehicle models with side airbags

Thirty-four percent of 50,000 respondents to a J.D. Power survey said they "definitely want" side airbags, up from 18 percent in 1997 (2002 Feature Contenting Report). Another J.D. Power survey reveals side airbags at the top of the list of 19 vehicle features respondents said they want. More and more automakers are offering side airbags as standard or optional equipment. Still, reported sales of optional side airbags are low.

(continues on p.11)

#### FORD ESCAPE WITH SIDE AIRBAGS: GOOD

Almost 10,000 passenger vehicle occupants die each year in side impacts, and head injuries are a leading cause. Side airbags designed specifically to protect the head can reduce such deaths and the even more numerous nonfatal head injuries that occur in side impacts.

Both of the small SUVs with good overall ratings in the Institute's side impact test (see p.5) are equipped with side airbags designed to protect the heads of front-seat occupants. These are standard on the Subaru Forester and optional on the Ford Escape. The Hyundai Santa Fe, which also has standard side airbags with head protection, earned an acceptable rating. In contrast, none of the seven small SUVs with poor ratings is equipped with standard side airbags designed to protect the head. And none of the small SUVs the Institute tested has side airbags to protect the heads of people in rear seats.

Note about side airbags in tested vehicles: Saturn does offer optional inflatable curtains, which cover front and rear seating positions. However, when side airbags are optional the Institute tests vehicles without this option. If a manufacturer selling optional side airbags requests the Institute to conduct an additional test of a vehicle with this

# WITHOUT SIDE AIRBAGS: POOR

option and agrees to reimburse the cost of the vehicle, a second test is conducted. General Motors didn't request such a test for the VUE, but Ford did request the Institute to test an Escape with optional side airbags. The Honda CR-V and Element plus the Mitsubishi Outlander have optional side airbags to protect the thorax, but neither of these manufacturers requested a second test with this option.

### STATUS INSURANCE INSTITUTE ORT

NON-PROFIT ORG. U.S. POSTAGE PAID PERMIT NO. 252 ARLINGTON, VA

#### Special issue

1005 N. Glebe Rd., Arlington, VA 22201 Phone 703/247-1500 Fax 247-1588 Internet: www.highwaysafety.org Vol. 38, No. 7, June 28, 2003

This special issue focuses on side impact crashworthiness evaluations of small SUVs. Recent special issues have focused on the following subjects:

Vehicle incompatibility 38:5 (2003) Highway safety as a priority 37:10 (2002) Automated enforcement 37:5 (2002) Motorcycle deaths 37:1 (2002) Elderly drivers 36:8 (2001) 36:5 (2001) What works & doesn't work Vehicle improvements 36:3 (2001) Side impact protection 36:1 (2001) State traffic safety laws 35:10 (2000) Driver death rates 35:7 (2000)

Contents may be republished with attribution. 1 0018-988X

If you want to join the *Status Report* mail list, remove your name from it, or change your address, email StatusReport@iihs.org. Or call or write the Institute.

The Jeep Wrangler was only a marginal performer in the Institute's side impact crash test, but this is a better rating than 7 other small SUVs earned (see p.5).

The Insurance Institute for Highway Safety is an independent, nonprofit, scientific and educational organization dedicated to reducing the losses — deaths, injuries, and property damage — from crashes on the nation's highways. The Institute is wholly supported by automobile insurers:
